THIS IS SECURITY AUDIT REPORT DOCUMENT AND WHICH MAY CONTAIN INFORMATION WHICH IS CONFIDENTIAL. WHICH INCLUDES ANY POTENTIAL VULNERABILITIES AND MALICIOUS CODES WHICH CAN BE USED TO EXPLOIT THE SOFTWARE. THIS MUST BE REFERRED INTERNALLY AND ONLY SHOULD BE MADE AVAILABLE TO THE PUBLIC AFTER ISSUES ARE RESOLVED.

> This is a private and confidential document. No part of this document should be disclosed to third party without prior written permission of EtherAuthority.

Introduction

EtherAuthority was contracted by Amplify to perform the Security audit of the Amplify Protocol smart contracts code. The audit has been performed using manual analysis as well as using automated software tools. This report presents all the findings regarding the audit performed on April 23rd, 2022.

The purpose of this audit was to address the following:

- Ensure that all claimed functions exist and function correctly.
- Identify any security vulnerabilities that may be present in the smart contract.

Project Background

The Amplify Contracts have functions like createVaultToken, addLiquidity, reinvest, redeem, mint, sync, skim, borrow, createCollateral, canBorrow, deployCollateral, etc.

Claimed Smart Contract Features

| Claimed Feature Detail | Our Observation |
|---|---------------------|
| File 1 BAllowance.sol Decimals: 18 Reserve Factor: 0.1 Minimum Liquidity: 1000 KinkUtilization:0.7 Borrow Index: 1 | YES, This is valid. |
| File 2 BDeployer.solBorrow Fee: 0.1% | YES, This is valid. |
| File 3 BInterestRateModel.sol Kink Multiplier: 5 Kink Borrow Rate Max: 100% Per Year Kink Borrow Rate min: 1% Per Year | YES, This is valid. |
| File 4 Borrowable.sol Borrow Fee: 0.1% Decimals: 18 Kink UR Maximum: 1 Kink UR Min: 0.5 KinkUtilization: 0.7 Minimum Liquidity: 10000 | YES, This is valid. |
| File 5 BSetter.sol Reserve Factor Max: 20% Kink Ur Min: 50% Kink Ur Max: 99% Adjust Speed Min: 0.5% Per Day Adjust Speed Max: 50% Per Day | YES, This is valid. |
| File 6 BStorage.solkink Borrow Rate: 10% per year | YES, This is valid. |

This is a private and confidential document. No part of this document should be disclosed to third party without prior written permission of EtherAuthority.

| | 1 |
|---|---------------------|
| Reserve Factor: 10% | |
| Kink Utilization Rate: 70% | |
| Adjust Speed: 5% per day | |
| File 7 CDeployer.sol | YES, This is valid. |
| • The CDeployer contract is used by the Factory to | |
| deploy Collateral(s). | |
| File 8 Collateral.sol | YES, This is valid. |
| Liquidation Incentive Min: 100% | |
| Liquidation Incentive Max: 105% | |
| Safety Margin Min: 100% | |
| Safety Margin Max: 250% | |
| File 9 CSetter.sol | YES, This is valid. |
| Liquidation Incentive Min: 100% | |
| Liquidation Incentive Max: 105% | |
| Safety Margin Min: 100% | |
| Safety Margin Max: 250% | |
| File 10 CStorage.sol | YES, This is valid. |
| Safety Margin Sqrt: 250% | |
| Liquidation Incentive: 4% | |
| File 11 EleosERC20.sol | YES, This is valid. |
| Decimals: 18 | |
| File 12 EleosPriceOracle.sol | YES, This is valid. |
| • Min T: 1200 | |
| File 13 Factory.sol | YES, This is valid. |
| Factory has functions like: _createLendingPool, | |
| createCollateral, createBorrowable0, etc. | |
| File 14 PoolToken.sol | YES, This is valid. |
| Decimals: 18 | |
| | |

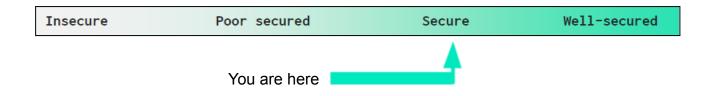

This is a private and confidential document. No part of this document should be disclosed to third party without prior written permission of EtherAuthority.

| Minimum Liquidity: 1000 | |
|---|---------------------|
| File 15 Router02.sol Router02 has functions like: mint, mintETH, mintCollateral, Redeem, etc. | YES, This is valid. |
| File 16 VaultToken.sol Name: Eleos Vault Token Symbol: vELEOS Decimals: 18 Reinvest Bounty: 0.1 | YES, This is valid. |
| File 17 VaultTokenFactory.sol VaultTokenFactory has functions like: allVaultTokensLength, createVaultToken, etc. | YES, This is valid. |

This is a private and confidential document. No part of this document should be disclosed to third party without prior written permission of EtherAuthority.

Audit Summary

According to the standard audit assessment, Customer's solidity smart contracts are **"Secured"**. Also, these contracts do not contain owner control, which does make them fully decentralized.

We used various tools like Slither, Solhint and Remix IDE. At the same time this finding is based on critical analysis of the manual audit.

All issues found during automated analysis were manually reviewed and applicable vulnerabilities are presented in the Audit overview section. General overview is presented in AS-IS section and all identified issues can be found in the Audit overview section.

We found 0 critical, 0 high, 0 medium and 1 low and some very low level issues.

Investors Advice: Technical audit of the smart contract does not guarantee the ethical nature of the project. Any owner controlled functions should be executed by the owner with responsibility. All investors/users are advised to do their due diligence before investing in the project.

Technical Quick Stats

| Main Category | Subcategory | Result |
|------------------|---|-----------|
| Contract | Solidity version not specified | Passed |
| Programming | Solidity version too old | Passed |
| | Integer overflow/underflow | Passed |
| | Function input parameters lack of check | Passed |
| | Function input parameters check bypass | Passed |
| | Function access control lacks management | Passed |
| | Critical operation lacks event log | Passed |
| | Human/contract checks bypass | Passed |
| | Random number generation/use vulnerability | N/A |
| | Fallback function misuse | Passed |
| | Race condition | Passed |
| | Logical vulnerability | Passed |
| | Features claimed | Passed |
| | Other programming issues | Moderated |
| Code | Function visibility not explicitly declared | Passed |
| Specification | Var. storage location not explicitly declared | Passed |
| | Use keywords/functions to be deprecated | Passed |
| | Unused code | Passed |
| Gas Optimization | "Out of Gas" Issue | Passed |
| | High consumption 'for/while' loop | Passed |
| | High consumption 'storage' storage | Passed |
| | Assert() misuse | Passed |
| Business Risk | The maximum limit for mintage not set | Passed |
| | "Short Address" Attack | Passed |
| | "Double Spend" Attack | Passed |

Overall Audit Result: PASSED

This is a private and confidential document. No part of this document should be disclosed to third party without prior written permission of EtherAuthority.

Code Quality

This audit scope has 17 smart contract files. Smart contracts contain Libraries, Smart contracts, inherits and Interfaces. This is a compact and well written smart contract.

The libraries in the Amplify Protocol are part of its logical algorithm. A library is a different type of smart contract that contains reusable code. Once deployed on the blockchain (only once), it is assigned a specific address and its properties / methods can be reused many times by other contracts in the Amplify Protocol.

The Amplify team has not provided unit test scripts, which would have helped to determine the integrity of the code in an automated way.

Code parts are **not** well commented on smart contracts.

Documentation

We were given an Amplify Protocol smart contract code in the form of a file. The hash of that code is mentioned above in the table.

As mentioned above, code parts are **not well** commented. So it is not easy to quickly understand the programming flow as well as complex code logic. Comments are very helpful in understanding the overall architecture of the protocol.

Use of Dependencies

As per our observation, the libraries are used in this smart contracts infrastructure that are based on well known industry standard open source projects.

Apart from libraries, its functions are used in external smart contract calls.

AS-IS overview

Severity Definitions

| Risk Level | Description | |
|---|--|--|
| Critical | Critical vulnerabilities are usually straightforward to exploit and can lead to token loss etc. | |
| Hìgh | High-level vulnerabilities are difficult to exploit; however, they also have significant impact on smart contract execution, e.g. public access to crucial | |
| Medium | Medium-level vulnerabilities are important to fix; however, they can't lead to tokens lose | |
| Low | Low-level vulnerabilities are mostly related to outdated, unused etc. code snippets, that can't have significant impact on execution | |
| Lowest / Code Style / Best Practice | Lowest-level vulnerabilities, code style violations and info statements can't affect smart contract execution and can be ignored. | |

This is a private and confidential document. No part of this document should be disclosed to third party without prior written permission of EtherAuthority.

Audit Findings

Critical Severity

No Critical severity vulnerabilities were found.

High Severity

No High severity vulnerabilities were found.

Medium

No Medium severity vulnerabilities were found.

Low

(1) Anyone can call setFactory() external function: PoolToken.sol

There is an external function _setFactory(), Anyone can call that function and update the factory address owner itself.

Resolution: Deployer has to confirm before deploying the contract to production.

Very Low / Informational / Best practices:

(1) Warning: Visibility for constructor is ignored:

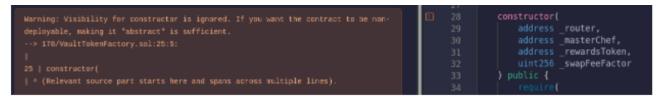

CDeployer.sol

Router02.sol

| | 1 39 | constructor(|
|--|------|---------------------|
| Marning: Visibility for constructor is ignored. If you want the contract | 40 | address factory, |
| to be non-deployable, making it "abstract" is sufficient. | 41 | address bDeployer, |
| > 178/Rouler02.sol:39:5: | 42 | address cDeployer, |
| | 43 | address WETH |
| 39 constructor(| 44 |) public (|
| ^ (Relevant source part starts here and spans across multiple lines). | 45 | factory = _factory; |
| | A.6 | hAnlover - hAnlover |

VaultTokenFactory.sol

Resolution: Warning: Visibility for constructor is ignored. If you want the contract to be non-deployable, making it "abstract" is sufficient.

(2) SafeMath Library: EleosERC20.sol, PoolToken.sol

SafeMath Library is used in this contract code, but the compiler version is greater than or equal to 0.8.0, Then it will not be required to use, solidity automatically handles overflow / underflow.

Resolution: We suggest removing the SafeMath library and use normal math operators, It will improve code size, and less gas consumption.

(3) Warning: Unused local variable: EleosPriceOracle.sol

Warning: Unused local variable.

Pair storage pairStorage = getPair[uniswapV2Pair];

Resolution: We suggest removing unused variables from code.

This is a private and confidential document. No part of this document should be disclosed to third party without prior written permission of EtherAuthority.

Conclusion

We were given a contract code in the form of files. And we have used all possible tests based on given objects as files. We had observed some issues in the smart contracts, but they were resolved in the revised smart contract code. **So, the smart contracts are ready for the mainnet deployment**.

Since possible test cases can be unlimited for such smart contracts protocol, we provide no such guarantee of future outcomes. We have used all the latest static tools and manual observations to cover maximum possible test cases to scan everything.

Smart contracts within the scope were manually reviewed and analyzed with static analysis tools. Smart Contract's high-level description of functionality was presented in the As-is overview section of the report.

Audit report contains all found security vulnerabilities and other issues in the reviewed code.

Security state of the reviewed contract, based on standard audit procedure scope, is "Secured".

Our Methodology

We like to work with a transparent process and make our reviews a collaborative effort. The goals of our security audits are to improve the quality of systems we review and aim for sufficient remediation to help protect users. The following is the methodology we use in our security audit process.

Manual Code Review:

In manually reviewing all of the code, we look for any potential issues with code logic, error handling, protocol and header parsing, cryptographic errors, and random number generators. We also watch for areas where more defensive programming could reduce the risk of future mistakes and speed up future audits. Although our primary focus is on the in-scope code, we examine dependency code and behavior when it is relevant to a particular line of investigation.

Vulnerability Analysis:

Our audit techniques included manual code analysis, user interface interaction, and whitebox penetration testing. We look at the project's web site to get a high level understanding of what functionality the software under review provides. We then meet with the developers to gain an appreciation of their vision of the software. We install and use the relevant software, exploring the user interactions and roles. While we do this, we brainstorm threat models and attack surfaces. We read design documentation, review other audit results, search for similar projects, examine source code dependencies, skim open issue tickets, and generally investigate details other than the implementation.

Documenting Results:

We follow a conservative, transparent process for analyzing potential security vulnerabilities and seeing them through successful remediation. Whenever a potential issue is discovered, we immediately create an Issue entry for it in this document, even though we have not yet verified the feasibility and impact of the issue. This process is conservative because we document our suspicions early even if they are later shown to not represent exploitable vulnerabilities. We generally follow a process of first documenting the suspicion with unresolved questions, then confirming the issue through code analysis, live experimentation, or automated tests. Code analysis is the most tentative, and we strive to provide test code, log captures, or screenshots demonstrating our confirmation. After this we analyze the feasibility of an attack in a live system.

Suggested Solutions:

We search for immediate mitigations that live deployments can take, and finally we suggest the requirements for remediation engineering for future releases. The mitigation and remediation recommendations should be scrutinized by the developers and deployment engineers, and successful mitigation and remediation is an ongoing collaborative process after we deliver our report, and before the details are made public.

Disclaimers

EtherAuthority.io Disclaimer

EtherAuthority team has analyzed this smart contract in accordance with the best industry practices at the date of this report, in relation to: cybersecurity vulnerabilities and issues in smart contract source code, the details of which are disclosed in this report, (Source Code); the Source Code compilation, deployment and functionality (performing the intended functions).

Due to the fact that the total number of test cases are unlimited, the audit makes no statements or warranties on security of the code. It also cannot be considered as a sufficient assessment regarding the utility and safety of the code, bugfree status or any other statements of the contract. While we have done our best in conducting the analysis and producing this report, it is important to note that you should not rely on this report only. We also suggest conducting a bug bounty program to confirm the high level of security of this smart contract.

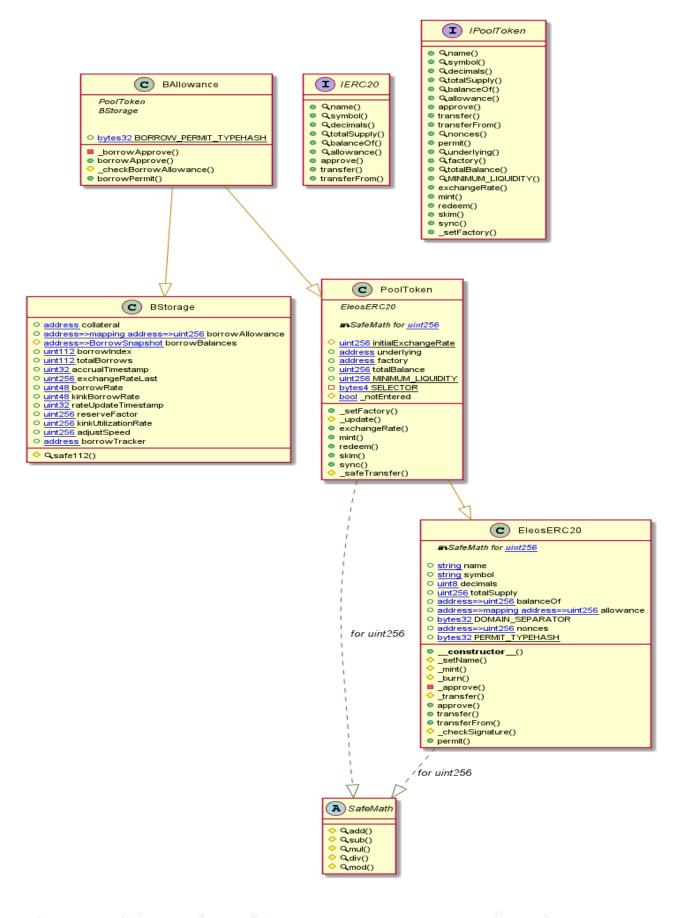

Technical Disclaimer

Smart contracts are deployed and executed on the blockchain platform. The platform, its programming language, and other software related to the smart contract can have their own vulnerabilities that can lead to hacks. Thus, the audit can't guarantee explicit security of the audited smart contracts.

Solidity Static Analysis

BAllowance.sol

Security

Check-effects-interaction:

Potential violation of Checks-Effects-Interaction pattern in PoolToken._update(): Could potentially lead to re-entrancy vulnerability. Note: Modifiers are currently not considered by this static analysis. <u>more</u>

Pos: 489:4:

Gas & Economy

Gas costs:

Gas requirement of function BAllowance.borrowPermit is infinite: If the gas requirement of a function is higher than the block gas limit, it cannot be executed. Please avoid loops in your functions or actions that modify large areas of storage (this includes clearing or copying arrays in storage) Pos: 625:4:

Miscellaneous

Guard conditions:

Use "assert(x)" if you never ever want x to be false, not in any circumstance (apart from a bug in your code). Use "require(x)" if x can be false, due to e.g. invalid input or a failing external component. <u>more</u>

Pos: 616:12:

BDeployer.sol

Security

Inline assembly:

The Contract uses inline assembly, this is only advised in rare cases. Additionally static analysis modules do not parse inline Assembly, this can lead to wrong analysis results.

Pos: 2949:2:

Gas & Economy

Gas costs:

Gas requirement of function BDeployer.deployBorrowable is infinite: If the gas requirement of a function is higher than the block gas limit, it cannot be executed. Please avoid loops in your functions or actions that modify large areas of storage (this includes clearing or copying arrays in storage) Pos: 2946:1:

ERC

ERC20:

ERC20 contract's "decimals" function should have "uint8" as return type more Pos: 1569:4:

This is a private and confidential document. No part of this document should be disclosed to third party without prior written permission of EtherAuthority.

Guard conditions:

Use "assert(x)" if you never ever want x to be false, not in any circumstance (apart from a bug in your code). Use "require(x)" if x can be false, due to e.g. invalid input or a failing external component.

more Pos: 2869:12:

Data truncated:

Division of integer values yields an integer value again. That means e.g. 10 / 100 = 0 instead of 0.1 since the result is an integer again. This does not hold for division of (only) literal values since those yield rational constants.

Pos: 2638:17:

BInterestRateModel.sol

Security

Block timestamp:

Use of "block.timestamp": "block.timestamp" can be influenced by miners to a certain degree. That means that a miner can "choose" the block.timestamp, to a certain degree, to change the outcome of a transaction in the mined block.

<u>more</u>

Pos: 683:16:

Gas & Economy

Gas costs:

Gas requirement of function BInterestRateModel.getBlockTimestamp is infinite: If the gas requirement of a function is higher than the block gas limit, it cannot be executed. Please avoid loops in your functions or actions that modify large areas of storage (this includes clearing or copying arrays in storage) Pos: 682:1:

Miscellaneous

Similar variable names:

BInterestRateModel._calculateBorrowRate() : Variables have very similar names "KINK_BORROW_RATE_MAX" and "KINK_BORROW_RATE_MIN". Note: Modifiers are currently not considered by this static analysis. Pos: 631:64:

> This is a private and confidential document. No part of this document should be disclosed to third party without prior written permission of EtherAuthority.

PoolToken.sol

Security

Check-effects-interaction:

Potential violation of Checks-Effects-Interaction pattern in PoolToken._update(): Could potentially lead to re-entrancy vulnerability. Note: Modifiers are currently not considered by this static analysis. <u>more</u>

Pos: 458:4:

Low level calls:

Use of "call": should be avoided whenever possible. It can lead to unexpected behavior if return value is not handled properly. Please use Direct Calls via specifying the called contract's interface. <u>more</u> Pos: 528:44:

Gas & Economy

Gas costs:

Gas requirement of function PoolToken.sync is infinite: If the gas requirement of a function is higher than the block gas limit, it cannot be executed. Please avoid loops in your functions or actions that modify large areas of storage (this includes clearing or copying arrays in storage) Pos: 519:4:

ERC20:

ERC20 contract's "decimals" function should have "uint8" as return type <u>more</u> Pos: 199:4:

Miscellaneous

Constant/View/Pure functions:

PoolToken.exchangeRate() : Potentially should be constant/view/pure but is not. Note: Modifiers are currently not considered by this static analysis.

Pos: 463:4:

Similar variable names:

PoolToken.mint(address) : Variables have very similar names "balanceOf" and "balance". Note: Modifiers are currently not considered by this static analysis. Pos: 479:29:

This is a private and confidential document. No part of this document should be disclosed to third party without prior written permission of EtherAuthority.

Guard conditions:

Use "assert(x)" if you never ever want x to be false, not in any circumstance (apart from a bug in your code). Use "require(x)" if x can be false, due to e.g. invalid input or a failing external component. <u>more</u> Dec: E40:8:

Pos: 540:8:

Router02.sol

Block timestamp:

Use of "block.timestamp": "block.timestamp" can be influenced by miners to a certain degree. That means that a miner can "choose" the block.timestamp, to a certain degree, to change the outcome of a transaction in the mined block.

more

Pos: 1136:28:

Gas & Economy

Gas costs:

Gas requirement of function Router02.borrow is infinite: If the gas requirement of a function is higher than the block gas limit, it cannot be executed. Please avoid loops in your functions or actions that modify large areas of storage (this includes clearing or copying arrays in storage) Pos: 1284:4:

Gas costs:

Gas requirement of function Router02.borrowETH is infinite: If the gas requirement of a function is higher than the block gas limit, it cannot be executed. Please avoid loops in your functions or actions that modify large areas of storage (this includes clearing or copying arrays in storage) Pos: 1295:4:

ERC20:

ERC20 contract's "decimals" function should have "uint8" as return type more Pos: 689:4:

Similar variable names:

Router02._optimalLiquidity(address,uint256,uint256,uint256,uint256) : Variables have very similar names "reserveA" and "reserveB". Note: Modifiers are currently not considered by this static analysis. Pos: 1780:27:

Data truncated:

Division of integer values yields an integer value again. That means e.g. 10 / 100 = 0 instead of 0.1 since the result is an integer again. This does not hold for division of (only) literal values since those yield rational constants. Pos: 1811:18:
