THIS IS SECURITY AUDIT REPORT DOCUMENT AND WHICH MAY CONTAIN INFORMATION WHICH IS CONFIDENTIAL. WHICH INCLUDES ANY POTENTIAL VULNERABILITIES AND MALICIOUS CODES WHICH CAN BE USED TO EXPLOIT THE SOFTWARE. THIS MUST BE REFERRED INTERNALLY AND ONLY SHOULD BE MADE AVAILABLE TO THE PUBLIC AFTER ISSUES ARE RESOLVED.

Introduction

EtherAuthority was contracted by the EntyLabs team to perform the Security audit of the Enty Token smart contract code. The audit has been performed using manual analysis as well as using automated software tools. This report presents all the findings regarding the audit performed on March 24th, 2023.

The purpose of this audit was to address the following:

- Ensure that all claimed functions exist and function correctly.
- Identify any security vulnerabilities that may be present in the smart contract.

Project Background

- The token follows ERC20 standard, which will make it compatible with all the platforms who support ERC20 standard.
- The token is without any other custom functionality and without any ownership control, which makes it truly decentralized

Audit scope

| | |
|-------------------------|---|
| Name | Code Review and Security Analysis Report for Enty Token Smart Contract |
| Platform | Polygon / Solidity |
| File Name | ENTY.sol |
| Contract Address | 0x25B70Fa255fB51b40E82A73B1661e95D8c568870 |
| File MD5 Hash | 8EB643D5DE27D4534D3FF0F8A2DF6ADA |
| Audit Date | March 24th, 2023 |

Claimed Smart Contract Features

| Claimed Feature Detail | Our Observation |
|--|-----------------------------------|
| <p>Tokenomics:</p> <ul style="list-style-type: none">• Name: Enty• Token Ticker: ENTY• Total Supply: 10 Billion Tokens (10,000,000,000)• New token minting: Not possible | <p>YES, This is valid.</p> |
| <p><u>Owner Specifications:</u></p> <ul style="list-style-type: none">• There are no owner functions, which makes it 100% decentralized. | <p>YES, This is valid.</p> |

Audit Summary

According to the standard audit assessment, Customer`s solidity based smart contracts are **“Well Secured”**. This token contract does not have any ownership control, hence it is **100% decentralized**.

We used various tools like Slither, Solhint and Remix IDE. At the same time this finding is based on critical analysis of the manual audit.

All issues found during automated analysis were manually reviewed and applicable vulnerabilities are presented in the Audit overview section. General overview is presented in AS-IS section and all identified issues can be found in the Audit overview section.

We found 0 critical, 0 high, 0 medium and 0 low and some very low level issues. And these issues are fixed / acknowledged which is a good thing.

Investors Advice: Technical audit of the smart contract does not guarantee the ethical nature of the project. Any owner controlled functions should be executed by the owner with responsibility. All investors/users are advised to do their due diligence before investing in the project.

Technical Quick Stats

| Main Category | Subcategory | Result |
|----------------------|---|--------|
| Contract Programming | Solidity version not specified | Passed |
| | Solidity version too old | Passed |
| | Integer overflow/underflow | Passed |
| | Function input parameters lack of check | Passed |
| | Function input parameters check bypass | Passed |
| | Function access control lacks management | Passed |
| | Critical operation lacks event log | Passed |
| | Human/contract checks bypass | Passed |
| | Random number generation/use vulnerability | N/A |
| | Fallback function misuse | Passed |
| | Race condition | Passed |
| | Logical vulnerability | Passed |
| | Features claimed | Passed |
| | Other programming issues | Passed |
| Code Specification | Function visibility not explicitly declared | Passed |
| | Var. storage location not explicitly declared | Passed |
| | Use keywords/functions to be deprecated | Passed |
| | Unused code | Passed |
| Gas Optimization | "Out of Gas" Issue | Passed |
| | High consumption 'for/while' loop | Passed |
| | High consumption 'storage' storage | Passed |
| | Assert() misuse | Passed |
| Business Risk | The maximum limit for mintage not set | Passed |
| | "Short Address" Attack | Passed |
| | "Double Spend" Attack | Passed |

Overall Audit Result: **PASSED**

Code Quality

This audit scope has 1 smart contract. Smart contract contains Libraries, Smart contracts, inherits and Interfaces. This is a compact and well written smart contract.

The libraries in ENTY Token are part of its logical algorithm. A library is a different type of smart contract that contains reusable code. Once deployed on the blockchain (only once), it is assigned a specific address and its properties / methods can be reused many times by other contracts in the ENTY Token.

The ENTY Token team has not provided scenario and unit test scripts, which would have helped to determine the integrity of the code in an automated way.

Code parts are **well** commented on in the smart contracts. Ethereum's NatSpec commenting style is used, which is a good thing.

Documentation

We were given an ENTY Token smart contract code in the form of a file. The hash of that code is mentioned above in the table.

As mentioned above, code parts are **well** commented. So it is easy to quickly understand the programming flow as well as complex code logic. Comments are very helpful in understanding the overall architecture of the protocol.

Use of Dependencies

As per our observation, the libraries are used in this smart contract infrastructure that are based on well known industry standard open source projects.

Apart from libraries, its functions are not used in external smart contract calls.

AS-IS overview

Functions

| Sl. | Functions | Type | Observation | Conclusion |
|-----|----------------------|----------|-------------|------------|
| 1 | constructor | write | Passed | No Issue |
| 2 | msgSender | internal | Passed | No Issue |
| 3 | _msgData | internal | Passed | No Issue |
| 4 | name | read | Passed | No Issue |
| 5 | symbol | read | Passed | No Issue |
| 6 | decimals | read | Passed | No Issue |
| 7 | totalSupply | read | Passed | No Issue |
| 8 | balanceOf | read | Passed | No Issue |
| 9 | transfer | write | Passed | No Issue |
| 10 | allowance | read | Passed | No Issue |
| 11 | approve | write | Passed | No Issue |
| 12 | transferFrom | write | Passed | No Issue |
| 13 | increaseAllowance | write | Passed | No Issue |
| 14 | decreaseAllowance | write | Passed | No Issue |
| 15 | transfer | internal | Passed | No Issue |
| 16 | _mint | internal | Passed | No Issue |
| 17 | burn | internal | Passed | No Issue |
| 18 | _approve | internal | Passed | No Issue |
| 21 | _spendAllowance | internal | Passed | No Issue |
| 22 | _beforeTokenTransfer | internal | Passed | No Issue |
| 23 | _afterTokenTransfer | internal | Passed | No Issue |

Severity Definitions

| Risk Level | Description |
|--|--|
| Critical | Critical vulnerabilities are usually straightforward to exploit and can lead to token loss etc. |
| High | High-level vulnerabilities are difficult to exploit; however, they also have significant impact on smart contract execution, e.g. public access to crucial |
| Medium | Medium-level vulnerabilities are important to fix; however, they can't lead to tokens lose |
| Low | Low-level vulnerabilities are mostly related to outdated, unused etc. code snippets, that can't have significant impact on execution |
| Lowest / Code Style / Best Practice | Lowest-level vulnerabilities, code style violations and info statements can't affect smart contract execution and can be ignored. |

Audit Findings

Critical Severity

No Critical severity vulnerabilities were found.

High Severity

No high severity vulnerabilities were found.

Medium

No medium severity vulnerabilities were found.

Low

No Low severity vulnerabilities were found.

Very Low / Informational / Best practices:

(1) Approve function of ERC20 standard is used.

The 'approve' function of ERC20 standard can be manipulated by the Dapp owners. If the user approves to any phishing site, then it can drain all the tokens. So, we suggest you advise your users to double check the website before approving the allowance.

Centralization

The EntyLabs (ENTY) Token smart contract does not have any ownership control, hence it is **100% decentralized**.

Conclusion

We were given a contract code in the form of a file. And we have used all possible tests based on given objects as files. We have not observed any major issues in the smart contracts. So, **it's good to go for the mainnet deployment.**

Since possible test cases can be unlimited for such smart contracts protocol, we provide no such guarantee of future outcomes. We have used all the latest static tools and manual observations to cover maximum possible test cases to scan everything.

Smart contracts within the scope were manually reviewed and analyzed with static analysis tools. Smart Contract's high-level description of functionality was presented in the As-is overview section of the report.

Audit report contains all found security vulnerabilities and other issues in the reviewed code.

Security state of the reviewed smart contract, based on standard audit procedure scope, is **“Well Secured”**.

Our Methodology

We like to work with a transparent process and make our reviews a collaborative effort. The goals of our security audits are to improve the quality of systems we review and aim for sufficient remediation to help protect users. The following is the methodology we use in our security audit process.

Manual Code Review:

In manually reviewing all of the code, we look for any potential issues with code logic, error handling, protocol and header parsing, cryptographic errors, and random number generators. We also watch for areas where more defensive programming could reduce the risk of future mistakes and speed up future audits. Although our primary focus is on the in-scope code, we examine dependency code and behavior when it is relevant to a particular line of investigation.

Vulnerability Analysis:

Our audit techniques included manual code analysis, user interface interaction, and whitebox penetration testing. We look at the project's web site to get a high level understanding of what functionality the software under review provides. We then meet with the developers to gain an appreciation of their vision of the software. We install and use the relevant software, exploring the user interactions and roles. While we do this, we brainstorm threat models and attack surfaces. We read design documentation, review other audit results, search for similar projects, examine source code dependencies, skim open issue tickets, and generally investigate details other than the implementation.

Documenting Results:

We follow a conservative, transparent process for analyzing potential security vulnerabilities and seeing them through successful remediation. Whenever a potential issue is discovered, we immediately create an Issue entry for it in this document, even though we have not yet verified the feasibility and impact of the issue. This process is conservative because we document our suspicions early even if they are later shown to not represent exploitable vulnerabilities. We generally follow a process of first documenting the suspicion with unresolved questions, then confirming the issue through code analysis, live experimentation, or automated tests. Code analysis is the most tentative, and we strive to provide test code, log captures, or screenshots demonstrating our confirmation. After this we analyze the feasibility of an attack in a live system.

Suggested Solutions:

We search for immediate mitigations that live deployments can take, and finally we suggest the requirements for remediation engineering for future releases. The mitigation and remediation recommendations should be scrutinized by the developers and deployment engineers, and successful mitigation and remediation is an ongoing collaborative process after we deliver our report, and before the details are made public.

Disclaimers

EtherAuthority.io Disclaimer

EtherAuthority team has analyzed this smart contract in accordance with the best industry practices at the date of this report, in relation to: cybersecurity vulnerabilities and issues in smart contract source code, the details of which are disclosed in this report, (Source Code); the Source Code compilation, deployment and functionality (performing the intended functions).

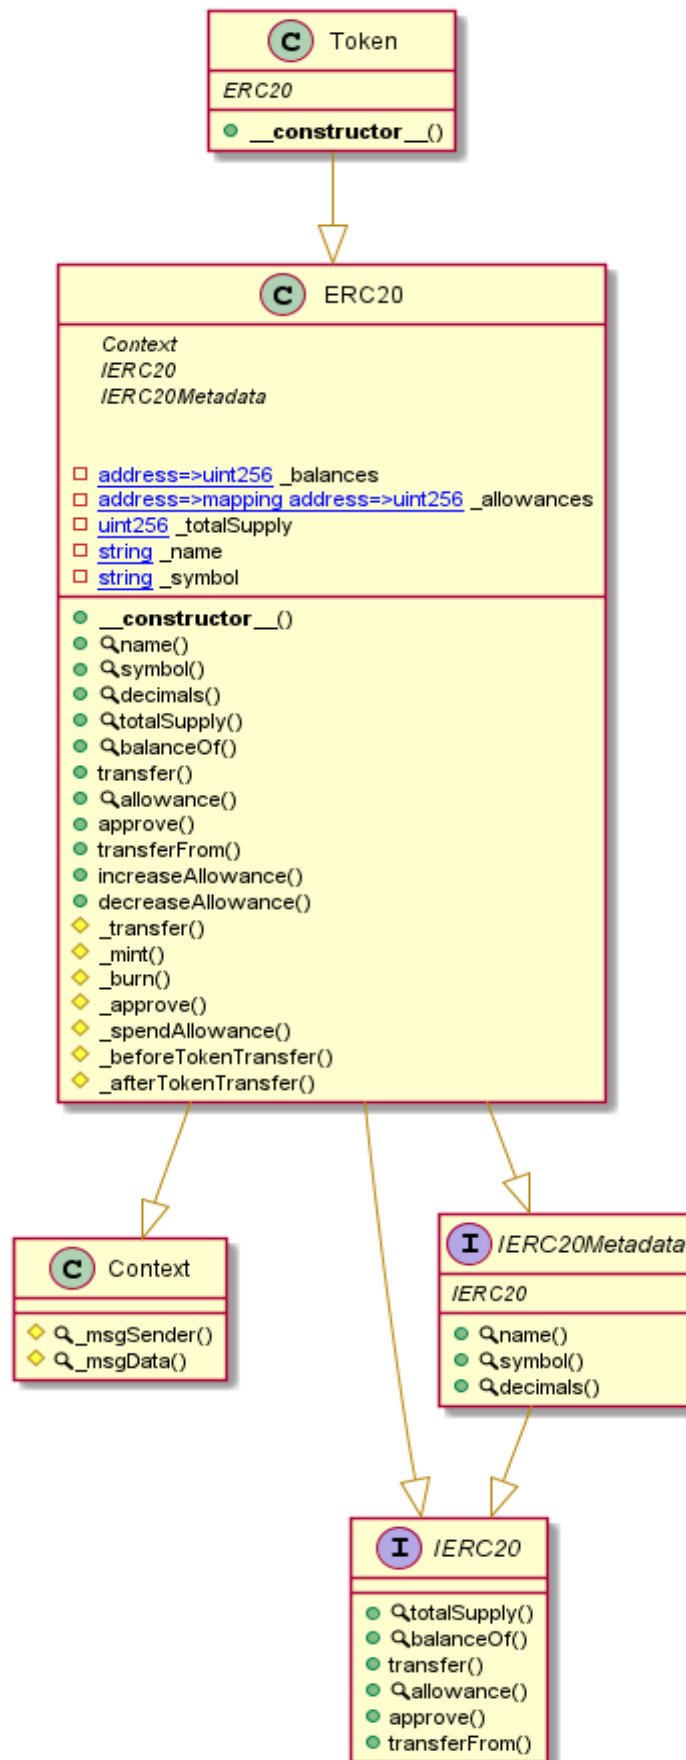

Due to the fact that the total number of test cases are unlimited, the audit makes no statements or warranties on security of the code. It also cannot be considered as a sufficient assessment regarding the utility and safety of the code, bugfree status or any other statements of the contract. While we have done our best in conducting the analysis and producing this report, it is important to note that you should not rely on this report only. We also suggest conducting a bug bounty program to confirm the high level of security of this smart contract.

Technical Disclaimer

Smart contracts are deployed and executed on the blockchain platform. The platform, its programming language, and other software related to the smart contract can have their own vulnerabilities that can lead to hacks. Thus, the audit can't guarantee explicit security of the audited smart contracts.

Slither Results Log

Slither Log >> ENTY.sol

```
Token.constructor(string,string,uint256).totalSupply (zspaul007.sol#533) shadows:  
  - ERC20.totalSupply() (zspaul007.sol#230-232) (function)  
  - IERC20.totalSupply() (zspaul007.sol#54) (function)  
Reference: https://github.com/crytic/slither/wiki/Detector-Documentation#local-variable-shadowing  
  
Context._msgData() (zspaul007.sol#22-24) is never used and should be removed  
ERC20._burn(address,uint256) (zspaul007.sol#421-437) is never used and should be removed  
Reference: https://github.com/crytic/slither/wiki/Detector-Documentation#dead-code  
  
Pragma version0.8.17 (zspaul007.sol#5) necessitates a version too recent to be trusted. Consider deploying with 0.6.12/0.7.6/0.8.16  
solc-0.8.17 is not recommended for deployment  
Reference: https://github.com/crytic/slither/wiki/Detector-Documentation#incorrect-versions-of-solidity  
zspaul007.sol analyzed (5 contracts with 84 detectors), 5 result(s) found

Solidity Static Analysis

ENTY.sol

Gas & Economy

Gas costs:

Gas requirement of function `Token.decreaseAllowance` is infinite: If the gas requirement of a function is higher than the block gas limit, it cannot be executed. Please avoid loops in your functions or actions that modify large areas of storage (this includes clearing or copying arrays in storage)

Pos: 337:4:

Gas costs:

Gas requirement of function `Token.transferFrom` is infinite: If the gas requirement of a function is higher than the block gas limit, it cannot be executed. Please avoid loops in your functions or actions that modify large areas of storage (this includes clearing or copying arrays in storage)

Pos: 294:4:

Miscellaneous

Constant/View/Pure functions:

`ERC20._afterTokenTransfer(address,address,uint256)` : Potentially should be constant/view/pure but is not.

[more](#)

Pos: 520:4:

Guard conditions:

Use `"assert(x)"` if you never ever want `x` to be false, not in any circumstance (apart from a bug in your code). Use `"require(x)"` if `x` can be false, due to e.g. invalid input or a failing external component.

[more](#)

Pos: 479:12:

Solhint Linter

ARULSINGAM.sol

```
ENTY.sol:341:18: Error: Parse error: missing ';' at '{'  
ENTY.sol:374:18: Error: Parse error: missing ';' at '{'  
ENTY.sol:401:18: Error: Parse error: missing ';' at '{'  
ENTY.sol:428:18: Error: Parse error: missing ';' at '{'  
ENTY.sol:480:22: Error: Parse error: missing ';' at '{'
```

Software analysis result:

These software reported many false positive results and some are informational issues. So, those issues can be safely ignored.
