THIS IS SECURITY AUDIT REPORT DOCUMENT AND WHICH MAY CONTAIN INFORMATION WHICH IS CONFIDENTIAL. WHICH INCLUDES ANY POTENTIAL VULNERABILITIES AND MALICIOUS CODES WHICH CAN BE USED TO EXPLOIT THE SOFTWARE. THIS MUST BE REFERRED INTERNALLY AND ONLY SHOULD BE MADE AVAILABLE TO THE PUBLIC AFTER ISSUES ARE RESOLVED.

This is a private and confidential document. No part of this document should be disclosed to third party without prior written permission of EtherAuthority.

Email: audit@EtherAuthority.io

Introduction

EtherAuthority was contracted by What Is A Woman to perform the Security audit of the WIAW Token smart contracts code. The audit has been performed using manual analysis as well as using automated software tools. This report presents all the findings regarding the audit performed on June 10th, 2023.

The purpose of this audit was to address the following:

- Ensure that all claimed functions exist and function correctly.
- Identify any security vulnerabilities that may be present in the smart contract.

Project Background

- The WIAW contracts handle multiple contracts, and all contracts have different functions.
 - WIAWPresale: This contract is used to deposit and withdraw tokens.
 - WhatIsAWoman: This contract is used to add or remove account addresses from the blacklist and also update open and closed trade status.
- WIAW is a smart contract that has functions like withdrawing, depositing, claiming tokens, etc.

Audit scope

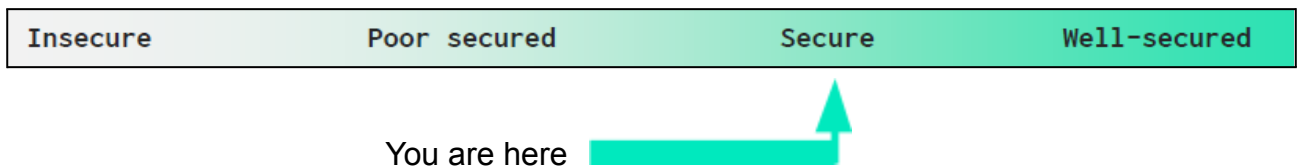

Name	Code Review and Security Analysis Report for What Is A Woman(WIAW) Token Smart Contracts
Platform	Ethereum / Solidity
File 1	WIAWPresale.sol
File 1 Initial code link	0x5369352cFC9d7B0702DD18B0eB3323d9DDEA4DE5
File 1 Revised code link	0x1c8346633e223d5fe6e80a52b6b653177d8d443d
File 2	WhatIsAWoman.sol
File 2 Initial code link	0xF92751a29816b0A8bca885935aFcF52A1F25F92f
Audit Date	June 10th, 2023
Revised Audit Date	June 16th, 2023

Claimed Smart Contract Features

Claimed Feature Detail	Our Observation
<p>File 1 WIAWPresale.sol</p> <ul style="list-style-type: none">● Get Rate: 0.00000001 WIAW per ETH <p><u>Owner has control over following functions:</u></p> <ul style="list-style-type: none">● Set the rate values.● SEt the payable wallet address.● Deposit amount.● Withdraw amount.	<p>YES, This is valid.</p>
<p>File 2 WhatsAWoman.sol</p> <ul style="list-style-type: none">● Name: What Is A Woman● Symbol: WIAW● Decimals: 18● Maximum transaction amount: 777 Trillion● Total Supply: 777 Trillion <p><u>Owner has control over following functions:</u></p> <ul style="list-style-type: none">● Set the account address status true/false in blackList.● Set the trade status true/false.● Set the maximum transaction limits.● Current owner can transfer ownership of the contract to a new account.● Deleting ownership will leave the contract without an owner, removing any owner-only functionality.	<p>YES, This is valid.</p>

Audit Summary

According to the standard audit assessment, Customer's solidity smart contracts are **"Secured"**. Also, these contracts do contain owner control, which does not make them fully decentralized.

We used various tools like Slither, Solhint and Remix IDE. At the same time this finding is based on critical analysis of the manual audit.

All issues found during automated analysis were manually reviewed and applicable vulnerabilities are presented in the Audit overview section. General overview is presented in AS-IS section and all identified issues can be found in the Audit overview section.

We found 0 critical, 0 high, 0 medium and 3 low and 2 very low level issues.

We confirm that 3 low severity issues and 1 informational issue have been resolved in the revised code.

Investors Advice: Technical audit of the smart contract does not guarantee the ethical nature of the project. Any owner controlled functions should be executed by the owner with responsibility. All investors/users are advised to do their due diligence before investing in the project.

Technical Quick Stats

Main Category	Subcategory	Result
Contract Programming	Solidity version not specified	Passed
	Solidity version too old	Passed
	Integer overflow/underflow	Passed
	Function input parameters lack of check	Passed
	Function input parameters check bypass	Passed
	Function access control lacks management	Passed
	Critical operation lacks event log	Passed
	Human/contract checks bypass	Passed
	Random number generation/use vulnerability	N/A
	Fallback function misuse	Passed
	Race condition	Passed
	Logical vulnerability	Passed
	Features claimed	Passed
	Other programming issues	Moderate
Code Specification	Function visibility not explicitly declared	Passed
	Var. storage location not explicitly declared	Passed
	Use keywords/functions to be deprecated	Passed
	Unused code	Passed
Gas Optimization	"Out of Gas" Issue	Passed
	High consumption 'for/while' loop	Passed
	High consumption 'storage' storage	Passed
	Assert() misuse	Passed
Business Risk	The maximum limit for mintage not set	Passed
	"Short Address" Attack	Passed
	"Double Spend" Attack	Passed

Overall Audit Result: **PASSED**

Code Quality

This audit scope has 2 smart contract files. Smart contracts contain Libraries, Smart contracts, inherits and Interfaces. This is a compact and well written smart contract.

The libraries in the WIAW Token are part of its logical algorithm. A library is a different type of smart contract that contains reusable code. Once deployed on the blockchain (only once), it is assigned a specific address and its properties / methods can be reused many times by other contracts in the WIAW Token.

The WIAW team has not provided unit test scripts, which would have helped to determine the integrity of the code in an automated way.

Code parts are not well commented on smart contracts.

Documentation

We were given a WIAW Protocol smart contract code in the form of a <https://etherscan.io> web link. The hash of that code is mentioned above in the table.

As mentioned above, code parts are not well commented. But the logic is straightforward. So it is easy to quickly understand the programming flow as well as complex code logic. Comments are very helpful in understanding the overall architecture of the protocol.

Another source of information was its official website: <https://www.wiawcoin.com> which provided rich information about the project architecture and tokenomics.

Use of Dependencies

As per our observation, the libraries are used in this smart contracts infrastructure that are based on well known industry standard open source projects.

Apart from libraries, its functions are used in external smart contract calls.

AS-IS overview

WIAWPresale.sol

Functions

Sl.	Functions	Type	Observation	Conclusion
1	constructor	write	Passed	No Issue
2	onlyOwner	modifier	Passed	No Issue
3	owner	read	Passed	No Issue

Email: audit@EtherAuthority.io

Severity Definitions

Risk Level	Description
Critical	Critical vulnerabilities are usually straightforward to exploit and can lead to token loss etc.
High	High-level vulnerabilities are difficult to exploit; however, they also have significant impact on smart contract execution, e.g. public access to crucial
Medium	Medium-level vulnerabilities are important to fix; however, they can't lead to tokens lose
Low	Low-level vulnerabilities are mostly related to outdated, unused etc. code snippets, that can't have significant impact on execution
Lowest / Code Style / Best Practice	Lowest-level vulnerabilities, code style violations and info statements can't affect smart contract execution and can be ignored.

Audit Findings

Critical Severity

No critical severity vulnerabilities were found in the contract code.

High Severity

No high severity vulnerabilities were found in the contract code.

Medium

No medium severity vulnerabilities were found in the contract code.

Low

(1) Owner can drain all the tokens: [WIAWPresale.sol](#)

Function: `withdraw()`

```
function withdraw(uint amount) external onlyOwner {
    require(
        token.balanceOf(address(this)) > 0,
        "There is not enough token in contract"
    );
    token.transfer(msg.sender, amount);
}
```

Using the `withdraw` function, the owner can drain all the tokens. It may cause trust issues like after the presale ends there may not be any tokens to claim.

Resolution: We suggest confirming this feature.

Status: Fixed

(2) User may not claim his tokens: [WIAWPresale.sol](#)

Users can claim his token only when the owner stops presales. It may happen that the owner will not stop presales. In that case all the users will lose their eth and will not get WIAW tokens.

Resolution: We suggest using locking time so after that all the users can claim his token without bothering whether the owner has set presale off.

Status: Fixed

(3) Wrong check for balance: [WIAWPresale.sol](#)

```
function buyTokens() public payable {
    require(hasPresaleStarted, "Presale not started");
    require(startTime >= block.timestamp, "Presale time has finished");
    require(msg.value >= 0.1 ether, "cant buy less with than 0.1 ETH");
    require(20 ether >= msg.value, "cannot buy with more than 20 ETH");
    uint256 weiAmount = msg.value;
    uint256 tokens = weiAmount * rate;
    require(
        token.balanceOf(address(this)) >= tokens,
        "Insufficient tokens in contract"
    );
    weiRaised += weiAmount;
}
```

Here only requested tokens are used to check if the presale contract has that many tokens, instead of total bought tokens plus the requested tokens.

Resolution: We suggest using total bought tokens plus the requested tokens to validate with the presale contract's token balance.

Status: Fixed

Very Low / Informational / Best practices:

(1) Initialized by default value: [WIAWPresale.sol](#)

Variable: hasPresaleStarted

```
//Presale status
bool private hasPresaleStarted = false;
```

Boolean variable has default value as false. The hasPresaleStarted variable has been initialized by the default boolean value, which is not needed.

Resolution: We suggest not initializing the boolean variable by false which is the default value.

Status: Fixed

(2) Extra check for token balance: [WIAWPresale.sol](#)

Variable: hasPresaleStarted

```
function buyTokens() public payable {
    require(hasPresaleStarted, "Presale not started");
    require(startTime >= block.timestamp, "Presale time has finished");
    require(msg.value >= 0.1 ether, "cant buy less with than 0.1 ETH");
    require(20 ether >= msg.value, "cannot buy with more than 20 ETH");
    uint256 weiAmount = msg.value;
    uint256 tokens = weiAmount * rate;
    uint256 alreadyBought = Customer[msg.sender].totalAmount;
    require(
        token.balanceOf(address(this)) >= tokens + alreadyBought,
        "Insufficient tokens in contract"
    );
    require(claimableTokens >= tokens, "Not enough tokens available");

    weiRaised += weiAmount;

    Customer[msg.sender].tokensBought += tokens;
    Customer[msg.sender].totalAmount += tokens;
}
```

Here 2 conditions are used to check for the tokens in contract. Second one is okay. No need for the first condition.

Resolution: We suggest removing the first condition to reduce gas fee.

Status: Acknowledged.

Centralization

This smart contract has some functions which can be executed by the Admin (Owner) only. If the admin wallet private key would be compromised, then it would create trouble. Following are Admin functions:

WIAWPresale.sol

- deposit: Deposit amount by the owner.
- withdraw: Withdraw amount by the owner.
- changeRate: Rate can be set by the owner.
- changeWallet: Payable wallet address can be set by the owner.
- StartPresale: Presale start can be set by the owner.

WhatIsAWoman.sol

- blacklistAccount: Account address set status true in blacklist.
- unBlackListAccount: Account address set status false in blacklist.
- openOrcloseTrade: Trade status set true/false by the owner.
- changemaxTxLimit: Maximum transaction limit can be set by the owner.

Ownable.sol

- renounceOwnership: Deleting ownership will leave the contract without an owner, removing any owner-only functionality.
- transferOwnership: Current owner can transfer ownership of the contract to a new account.
- _checkOwner: Throws if the sender is not the owner.

To make the smart contract 100% decentralized, we suggest renouncing ownership in the smart contract once its function is completed.

Conclusion

We were given a contract code in the form of a <https://etherscan.io> web link. And we have used all possible tests based on given objects as files. We had observed 3 low severity issues and 2 Informational severity issues in the smart contracts. We confirm that 3 low severity issues and 1 informational issue have been resolved in the revised code. **So, the smart contracts are ready for the mainnet deployment.**

Since possible test cases can be unlimited for such smart contracts protocol, we provide no such guarantee of future outcomes. We have used all the latest static tools and manual observations to cover maximum possible test cases to scan everything.

Smart contracts within the scope were manually reviewed and analyzed with static analysis tools. Smart Contract's high-level description of functionality was presented in the As-is overview section of the report.

The audit report contains all found security vulnerabilities and other issues in the reviewed code.

The security state of the reviewed contract, based on standard audit procedure scope, is **“Secured”**.

Our Methodology

We like to work with a transparent process and make our reviews a collaborative effort. The goals of our security audits are to improve the quality of systems we review and aim for sufficient remediation to help protect users. The following is the methodology we use in our security audit process.

Manual Code Review:

In manually reviewing all of the code, we look for any potential issues with code logic, error handling, protocol and header parsing, cryptographic errors, and random number generators. We also watch for areas where more defensive programming could reduce the risk of future mistakes and speed up future audits. Although our primary focus is on the in-scope code, we examine dependency code and behavior when it is relevant to a particular line of investigation.

Vulnerability Analysis:

Our audit techniques included manual code analysis, user interface interaction, and whitebox penetration testing. We look at the project's web site to get a high level understanding of what functionality the software under review provides. We then meet with the developers to gain an appreciation of their vision of the software. We install and use the relevant software, exploring the user interactions and roles. While we do this, we brainstorm threat models and attack surfaces. We read design documentation, review other audit results, search for similar projects, examine source code dependencies, skim open issue tickets, and generally investigate details other than the implementation.

Documenting Results:

We follow a conservative, transparent process for analyzing potential security vulnerabilities and seeing them through successful remediation. Whenever a potential issue is discovered, we immediately create an Issue entry for it in this document, even though we have not yet verified the feasibility and impact of the issue. This process is conservative because we document our suspicions early even if they are later shown to not represent exploitable vulnerabilities. We generally follow a process of first documenting the suspicion with unresolved questions, then confirming the issue through code analysis, live experimentation, or automated tests. Code analysis is the most tentative, and we strive to provide test code, log captures, or screenshots demonstrating our confirmation. After this we analyze the feasibility of an attack in a live system.

Suggested Solutions:

We search for immediate mitigations that live deployments can take, and finally we suggest the requirements for remediation engineering for future releases. The mitigation and remediation recommendations should be scrutinized by the developers and deployment engineers, and successful mitigation and remediation is an ongoing collaborative process after we deliver our report, and before the details are made public.

Disclaimers

EtherAuthority.io Disclaimer

EtherAuthority team has analyzed this smart contract in accordance with the best industry practices at the date of this report, in relation to: cybersecurity vulnerabilities and issues in smart contract source code, the details of which are disclosed in this report, (Source Code); the Source Code compilation, deployment and functionality (performing the intended functions).

Due to the fact that the total number of test cases are unlimited, the audit makes no statements or warranties on security of the code. It also cannot be considered as a sufficient assessment regarding the utility and safety of the code, bugfree status or any other statements of the contract. While we have done our best in conducting the analysis and producing this report, it is important to note that you should not rely on this report only. We also suggest conducting a bug bounty program to confirm the high level of security of this smart contract.

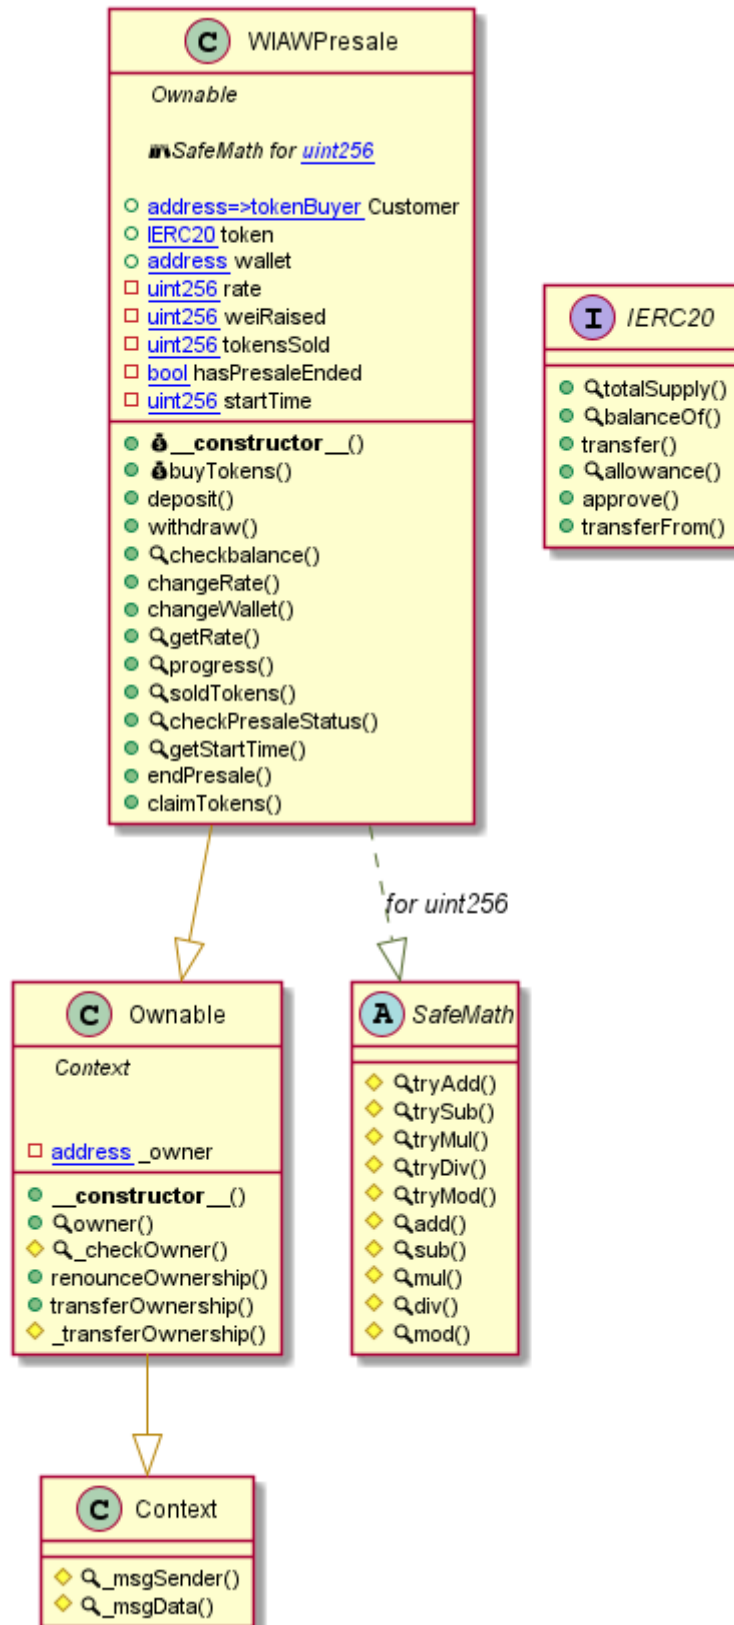

Technical Disclaimer

Smart contracts are deployed and executed on the blockchain platform. The platform, its programming language, and other software related to the smart contract can have their own vulnerabilities that can lead to hacks. Thus, the audit can't guarantee explicit security of the audited smart contracts.

Slither Results Log

Slither log >> WhatIsAWoman.sol

```
WhatIsAWoman.changeMaxTxLimit(uint256) (WhatIsAWoman.sol#685-687) should emit an event for:
- _maxTxAmount = amount (WhatIsAWoman.sol#686)
Reference: https://github.com/crytic/slither/wiki/Detector-Documentation#missing-events-arithmetic

WhatIsAWoman.transfer(address,address,uint256) (WhatIsAWoman.sol#656-671) compares to a boolean constant:
- require(bool,string)(isBlackListed[sender] != true && isBlackListed[recipient] != true,Account is Blacklisted) (WhatIsAWoman.sol#662)
Reference: https://github.com/crytic/slither/wiki/Detector-Documentation#boolean-equality

Context._msgData() (WhatIsAWoman.sol#27-29) is never used and should be removed
ERC20._burn(address,uint256) (WhatIsAWoman.sol#536-552) is never used and should be removed
Reference: https://github.com/crytic/slither/wiki/Detector-Documentation#dead-code

WhatIsAWoman.maxTxAmount (WhatIsAWoman.sol#649) is set pre-construction with a non-constant function or state variable:
- 777000000000000 * 10 ** decimals()
Reference: https://github.com/crytic/slither/wiki/Detector-Documentation#function-initializing-state

Pragma version^0.8.9 (WhatIsAWoman.sol#6) allows old versions
solc-0.8.9 is not recommended for deployment
Reference: https://github.com/crytic/slither/wiki/Detector-Documentation#incorrect-versions-of-solidity

Parameter WhatIsAWoman.openOrCloseTrade(bool)._status (WhatIsAWoman.sol#681) is not in mixedCase
Variable WhatIsAWoman._isTradeOpen (WhatIsAWoman.sol#648) is not in mixedCase
Variable WhatIsAWoman._maxTxAmount (WhatIsAWoman.sol#649) is not in mixedCase
Reference: https://github.com/crytic/slither/wiki/Detector-Documentation#conformance-to-solidity-naming-conventions

WhatIsAWoman.constructor() (WhatIsAWoman.sol#652-654) uses literals with too many digits:
- _mint(msg.sender,777000000000000 * 10 ** decimals()) (WhatIsAWoman.sol#653)
WhatIsAWoman.slitherConstructorVariables() (WhatIsAWoman.sol#645-690) uses literals with too many digits:
- _maxTxAmount = 777000000000000 * 10 ** decimals() (WhatIsAWoman.sol#649)
Reference: https://github.com/crytic/slither/wiki/Detector-Documentation#too-many-digits
WhatIsAWoman.sol analyzed (6 contracts with 84 detectors), 12 result(s) found
```

Slither log >> WIAWPresale.sol

```
WIAWPresale.changeRate(uint256) (WIAWPresale.sol#537-539) should emit an event for:
- rate = _rate (WIAWPresale.sol#538)
Reference: https://github.com/crytic/slither/wiki/Detector-Documentation#missing-events-arithmetic

WIAWPresale.changeWallet(address)._wallet (WIAWPresale.sol#541) lacks a zero-check on :
- wallet = _wallet (WIAWPresale.sol#542)
Reference: https://github.com/crytic/slither/wiki/Detector-Documentation#missing-zero-address-validation

WIAWPresale.claimTokens() (WIAWPresale.sol#571-615) uses timestamp for comparisons
Dangerous comparisons:
- block.timestamp >= startTime + 604800 (WIAWPresale.sol#585)
- block.timestamp >= startTime + 1209600 (WIAWPresale.sol#592)
- block.timestamp >= startTime + 1814400 (WIAWPresale.sol#599)
- block.timestamp >= startTime + 2419200 (WIAWPresale.sol#606)
Reference: https://github.com/crytic/slither/wiki/Detector-Documentation#block-timestamp

WIAWPresale.claimTokens() (WIAWPresale.sol#571-615) compares to a boolean constant:
-Customer[msg.sender].weekThree == false (WIAWPresale.sol#593)
WIAWPresale.claimTokens() (WIAWPresale.sol#571-615) compares to a boolean constant:
-Customer[msg.sender].weekFive == false (WIAWPresale.sol#607)
WIAWPresale.claimTokens() (WIAWPresale.sol#571-615) compares to a boolean constant:
-Customer[msg.sender].weekTwo == false (WIAWPresale.sol#586)
WIAWPresale.claimTokens() (WIAWPresale.sol#571-615) compares to a boolean constant:
-Customer[msg.sender].weekFour == false (WIAWPresale.sol#600)
WIAWPresale.claimTokens() (WIAWPresale.sol#571-615) compares to a boolean constant:
-Customer[msg.sender].weekOne == false (WIAWPresale.sol#579)
Reference: https://github.com/crytic/slither/wiki/Detector-Documentation#boolean-equality

Context._msgData() (WIAWPresale.sol#30-32) is never used and should be removed
SafeMath.add(uint256,uint256) (WIAWPresale.sol#317-319) is never used and should be removed
SafeMath.div(uint256,uint256,string) (WIAWPresale.sol#415-424) is never used and should be removed
SafeMath.mod(uint256,uint256) (WIAWPresale.sol#375-377) is never used and should be removed
SafeMath.mod(uint256,uint256,string) (WIAWPresale.sol#441-450) is never used and should be removed
SafeMath.sub(uint256,uint256) (WIAWPresale.sol#331-333) is never used and should be removed
SafeMath.sub(uint256,uint256,string) (WIAWPresale.sol#392-401) is never used and should be removed
SafeMath.tryAdd(uint256,uint256) (WIAWPresale.sol#231-240) is never used and should be removed

SafeMath.trySub(uint256,uint256) (WIAWPresale.sol#247-255) is never used and should be removed
Reference: https://github.com/crytic/slither/wiki/Detector-Documentation#dead-code

Pragma version^0.8 (WIAWPresale.sol#7) is too complex
solc-0.8.9 is not recommended for deployment
Reference: https://github.com/crytic/slither/wiki/Detector-Documentation#incorrect-versions-of-solidity

Low level call in WIAWPresale.buyTokens() (WIAWPresale.sol#500-518):
- (callSuccess) = address(wallet).call{value: msg.value}() (WIAWPresale.sol#516)
Reference: https://github.com/crytic/slither/wiki/Detector-Documentation#low-level-calls

Struct WIAWPresale.tokenBuyer (WIAWPresale.sol#457-465) is not in CapWords
Parameter WIAWPresale.changeRate(uint256)._rate (WIAWPresale.sol#537) is not in mixedCase
Parameter WIAWPresale.changeWallet(address)._wallet (WIAWPresale.sol#541) is not in mixedCase
Variable WIAWPresale.Customer (WIAWPresale.sol#468) is not in mixedCase
Reference: https://github.com/crytic/slither/wiki/Detector-Documentation#conformance-to-solidity-naming-conventions

WIAWPresale.slitherConstructorVariables() (WIAWPresale.sol#453-618) uses literals with too many digits:
- rate = 10000000000 (WIAWPresale.sol#477)
Reference: https://github.com/crytic/slither/wiki/Detector-Documentation#too-many-digits
WIAWPresale.sol analyzed (5 contracts with 84 detectors), 32 result(s) found

Solidity Static Analysis

WhatIsAWoman.sol

Gas & Economy

Gas costs:

Gas requirement of function `WhatIsAWoman.decreaseAllowance` is infinite: If the gas requirement of a function is higher than the block gas limit, it cannot be executed. Please avoid loops in your functions or actions that modify large areas of storage (this includes clearing or copying arrays in storage)

Pos: 443:4:

Miscellaneous

Constant/View/Pure functions:

`ERC20._afterTokenTransfer(address,address,uint256)` : Potentially should be constant/view/pure but is not. Note: Modifiers are currently not considered by this static analysis.

[more](#)

Pos: 638:4:

Guard conditions:

Use "`assert(x)`" if you never ever want `x` to be false, not in any circumstance (apart from a bug in your code). Use "`require(x)`" if `x` can be false, due to e.g. invalid input or a failing external component.

[more](#)

Pos: 666:12:

WIAWPresale.sol

Security

Check-effects-interaction:

Potential violation of Checks-Effects-Interaction pattern in `WIAWPresale.buyTokens()`: Could potentially lead to re-entrancy vulnerability. Note: Modifiers are currently not considered by this static analysis.

[more](#)

Pos: 500:4:

Low level calls:

Use of "call": should be avoided whenever possible. It can lead to unexpected behavior if return value is not handled properly. Please use Direct Calls via specifying the called contract's interface.

[more](#)

Pos: 516:31:

Gas & Economy

Gas costs:

Gas requirement of function WIAWPresale.buyTokens is infinite: If the gas requirement of a function is higher than the block gas limit, it cannot be executed. Please avoid loops in your functions or actions that modify large areas of storage (this includes clearing or copying arrays in storage)

Miscellaneous

Similar variable names:

WIAWPresale.buyTokens() : Variables have very similar names "token" and "tokens". Note: Modifiers are currently not considered by this static analysis.

Pos: 507:12:

Guard conditions:

Use "assert(x)" if you never ever want x to be false, not in any circumstance (apart from a bug in your code). Use "require(x)" if x can be false, due to e.g. invalid input or a failing external component.

Data truncated:

Division of integer values yields an integer value again. That means e.g. $10 / 100 = 0$ instead of 0.1 since the result is an integer again. This does not hold for division of (only) literal values since those yield rational constants.
