THIS IS SECURITY AUDIT REPORT DOCUMENT AND WHICH MAY CONTAIN INFORMATION WHICH IS CONFIDENTIAL. WHICH INCLUDES ANY POTENTIAL VULNERABILITIES AND MALICIOUS CODES WHICH CAN BE USED TO EXPLOIT THE SOFTWARE. THIS MUST BE REFERRED INTERNALLY AND ONLY SHOULD BE MADE AVAILABLE TO THE PUBLIC AFTER ISSUES ARE RESOLVED.

> This is a private and confidential document. No part of this document should be disclosed to third party without prior written permission of EtherAuthority.

Introduction

EtherAuthority was contracted by the Tyrion team to perform the Security audit of the Tyrion Staking smart contract code. The audit has been performed using manual analysis as well as using automated software tools. This report presents all the findings regarding the audit performed on September 16th, 2023.

The purpose of this audit was to address the following:

- Ensure that all claimed functions exist and function correctly.
- Identify any security vulnerabilities that may be present in the smart contract.

Project Background

- Tyrion is an innovative cryptocurrency ecosystem.
- The Tyrion Staking is a smart contract that has functionalities of stake/unstake tokens, rewards in the form of tokens.

Name	Code Review and Security Analysis Report for Tyrion Staking Smart Contract
Platform	BSC / Solidity
File	Tyrion_Staking.sol
Online code	0xFC6964d9e0141e7CFc37081A2B45429C17DCDd3d
Updated MD5 hash	4538D947C69F4611F248A99070985770
Audit Date	September 16th, 2023
Revised Audit Date	September 19th, 2023

Audit scope

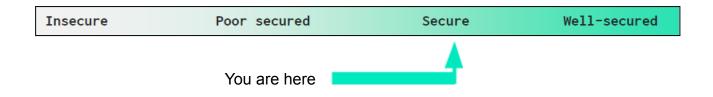

Claimed Smart Contract Features

Claimed Feature Detail	Our Observation
 Apy Timeframe: 1 day Lockup Period: 365 days Unstake request time: 14 days APY: 25% Minimum APY: 3% Penality: 10% Maximum investment: 1,00,000 TYON Minimum withdraw reward limit: 10 TYON Minimum investment: 100 TYON Total reward to distribute: 50 Million TYON 	YES, This is valid. The smart contract owner controls these functions, so the owner must handle the private key of the owner's wallet very securely. Because if the private key is compromised, then it will create problems.
 Ownership Control: Withdraw funds. Update APY values. Update investment values. Update penality. Update withdrawal limit. Update Lockup period. Update Distributed reward. Current owner can transfer the ownership. 	YES, This is valid.

This is a private and confidential document. No part of this document should be disclosed to third party without prior written permission of EtherAuthority.

Audit Summary

According to the standard audit assessment, Customer's solidity based smart contracts are "**Secured**". Also, these contracts contain owner control, which does not make them fully decentralized.

We used various tools like Slither, Solhint and Remix IDE. At the same time this finding is based on critical analysis of the manual audit.

All issues found during automated analysis were manually reviewed and applicable vulnerabilities are presented in the Audit overview section. General overview is presented in AS-IS section and all identified issues can be found in the Audit overview section.

We found 0 critical, 0 high, 1 medium and 1 low and 8 very low level issues. We confirm that these all issues are fixed / acknowledged in the revised smart contract code.

Investors Advice: Technical audit of the smart contract does not guarantee the ethical nature of the project. Any owner controlled functions should be executed by the owner with responsibility. All investors/users are advised to do their due diligence before investing in the project.

Technical Quick Stats

Main Category	Subcategory	Result
Contract	Solidity version not specified	Passed
Programming	Solidity version too old	Passed
	Integer overflow/underflow	Passed
	Function input parameters lack of check	Moderated
	Function input parameters check bypass	Passed
	Function access control lacks management	Passed
	Critical operation lacks event log	Passed
	Human/contract checks bypass	Passed
	Random number generation/use vulnerability	N/A
	Fallback function misuse	Passed
	Race condition	Passed
	Logical vulnerability	Passed
	Features claimed	Moderated
	Other programming issues	Passed
Code	Function visibility not explicitly declared	Passed
Specification	Var. storage location not explicitly declared	Passed
	Use keywords/functions to be deprecated	Passed
	Unused code	Moderated
Gas Optimization	"Out of Gas" Issue	Passed
	High consumption 'for/while' loop	Passed
	High consumption 'storage' storage	Passed
	Assert() misuse	Passed
Business Risk	The maximum limit for mintage not set	Passed
	"Short Address" Attack	Passed
	"Double Spend" Attack	Passed

Overall Audit Result: PASSED

This is a private and confidential document. No part of this document should be disclosed to third party without prior written permission of EtherAuthority.

Code Quality

This audit scope has 1 smart contract. Smart contract contains Libraries, Smart contracts, inherits and Interfaces. This is a compact and well written smart contract.

The libraries in Tyrion Staking are part of its logical algorithm. A library is a different type of smart contract that contains reusable code. Once deployed on the blockchain (only once), it is assigned a specific address and its properties / methods can be reused many times by other contracts in the Tyrion Staking.

The Tyrion Staking team has **not** provided scenario and unit test scripts, which would have helped to determine the integrity of the code in an automated way.

Code parts are not **well** commented on in the smart contracts. Ethereum's NatSpec commenting style is recommended.

Documentation

We were given a Tyrion Staking smart contract code in the form of a <u>bscscan.com</u> web link. The hash of that code is mentioned above in the table.

As mentioned above, code parts are not **well** commented. but The logic is straightforward. So it is easy to quickly understand the programming flow as well as complex code logic. Comments are very helpful in understanding the overall architecture of the protocol.

Another source of information was its official project URL: <u>https://www.tyrion.io</u> which provided rich information about the project architecture.

Use of Dependencies

As per our observation, the libraries are used in this smart contract infrastructure that are based on well known industry standard open source projects.

Apart from libraries, its functions are not used in external smart contract calls.

This is a private and confidential document. No part of this document should be disclosed to third party without prior written permission of EtherAuthority.

AS-IS overview

Functions

SI.	Functions	Туре	Observation	Conclusion
1	constructor	write	Passed	No Issue

This is a private and confidential document. No part of this document should be disclosed to third party without prior written permission of EtherAuthority.

Severity Definitions

Risk Level	Description
Critical	Critical vulnerabilities are usually straightforward to exploit and can lead to token loss etc.
High	High-level vulnerabilities are difficult to exploit; however, they also have significant impact on smart contract execution, e.g. public access to crucial
Medium	Medium-level vulnerabilities are important to fix; however, they can't lead to tokens lose
Low	Low-level vulnerabilities are mostly related to outdated, unused etc. code snippets, that can't have significant impact on execution
Lowest / Code Style / Best Practice	Lowest-level vulnerabilities, code style violations and info statements can't affect smart contract execution and can be ignored.

This is a private and confidential document. No part of this document should be disclosed to third party without prior written permission of EtherAuthority.

Audit Findings

Critical Severity

No Critical severity vulnerabilities were found.

High Severity

No High severity vulnerabilities were found.

Medium

(1) Value limit is not set:

```
{
  require(msg.sender==owner);
  maximum_investment = _value;
}
{
  require(msg.sender==owner);
  penality = _value;
}
function update_withdraw_limit(uint _value) public
                                 🖺 24799 gas
ł
  require(msg.sender==owner);
  minimum_withdraw_reward_limit = _value;
}
Ł
  require(msg.sender==owner);
  Lockup_period = _value;
```

In the listed functions, variable values can be set with any number.

An explicit range limit should be set for each variable according to its use in calculations:

- update_minimum_Apy
- update_minimum_investment
- update_max_investment
- update_penality
- update_withdraw_limit
- update_Lockup_period
- update_Apy_Timeframe
- update_APY
- update_distributed_reward

Resolution: Consider adding an explicit value to the values.

Status: Acknowledged

Low

(1) Critical operation lacks event log:

Missing event log for:

- Stake
- Unstake
- withdrawReward
- withdrawFunds

This is a private and confidential document. No part of this document should be disclosed to third party without prior written permission of EtherAuthority.

• unStake_Request

Resolution: Write an event log for the listed events. **Status: Fixed**

Very Low / Informational / Best practices:

(1) Hard Coded variable values:

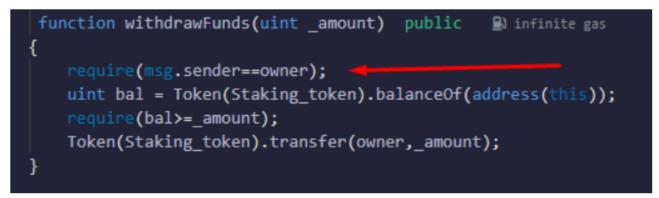

address public owner; address Staking_token=0xd8b934580fcE35a11B58C6D73aDeE468a2833fa8; //credit address Reward_Token =0xd8b934580fcE35a11B58C6D73aDeE468a2833fa8; // bel3

Staking_token and Reward_Token variables are set with hardcoded values.

Resolution: We advise always ensuring the set hardcoded values.

Status: Acknowledged

(2) Missing error message:

Error messages are missing in some functions. Requirements must have error messages.

Resolution: We suggest adding appropriate error messages.

Status: Fixed

(3) Make variables constant:

Staking_token and Reward_Token: These variable values will be unchanged. So, please make it constant. It will save some gas.

Resolution: We advise declaring those variables as constants. Just use a constant keyword. And define constants in the constructor.

Status: Fixed

(4) Unstake request not updated:

After executing unStake_Request user, unstake request details have not been updated with user information.

Resolution: We suggest checking code logic and making appropriate changes to update the information.

Status: Acknowledged

(5) Ambiguous Error Message:

The mentioned error message does not explain exactly the error of the operation.

Resolution: As error messages are intended to notify users about failing conditions, they should provide enough information so that appropriate corrections can be made to interact with the system.

Status: Acknowledged

(6) Features claimed:

uint public total_reward_to_distribute = 50000000*10**9;

In document, there are two values

- 1. Maximum rewards = 3 million
- 2. Total supply = 500 million

But In code total_reward_to_distribute is set by 50 million.

This is a private and confidential document. No part of this document should be disclosed to third party without prior written permission of EtherAuthority.

Resolution: We suggest confirming for the total rewards to be distributed. **Status:** Acknowledged

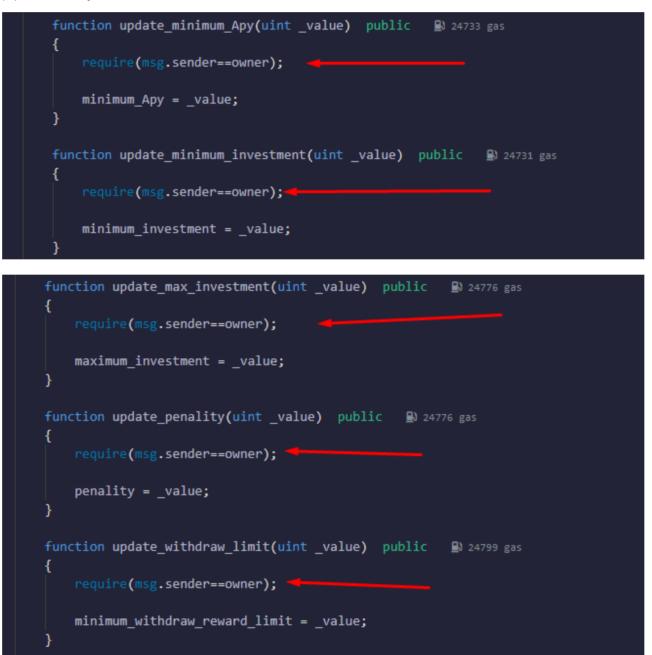

(7) Unused variable:

<pre>struct allInvestments{</pre>	
<pre>uint investedAmount; uint withdrawnTime; uint DepositTime; uint investmentNum; uint unstakeTime; bool unstake;</pre>	
uint reward;	
<pre>bool unstake_req; uint unstake_req_time; uint unstake_reqEnd_time; bool autoCompounding;</pre>	
B	

The withdrawnTime is allInvestments variable; its value is set in the stake function but never used anywhere in the contract.

Resolution: We suggest removing all unused variables. **Status: Fixed**

(8) Add "OnlyOwner" modifier:

Below, All the setter functions are accessible to only the owner. To check this, the required statement is written in all the setter functions.

- transferOwnership
- withdrawFunds
- update_minimum_Apy
- update_minimum_investment
- update_max_investment
- update_penality
- update_withdraw_limit
- update_Lockup_period
- update_Apy_Timeframe
- update_distributed_reward
- update_Unstake_request_time
- update_APY

Resolution: We advise adding the "OnlyOwner" modifier to check this accessibility, set the modifier in all the functions, and remove the required statements.

Status: Fixed

Centralization

This smart contract has some functions which can be executed by the Admin (Owner) only. If the admin wallet private key would be compromised, then it would create trouble. Following are Admin functions:

Tyrion_Staking.sol

- transferOwnership: The current owner can transfer ownership of the contract to a new account.
- withdrawFunds: The owner can withdraw funds.
- update_minimum_Apy: Minimum APY values can be updated by the owner.
- update_minimum_investment: Minimum investment values can be updated by the owner.
- update_max_investment: Maximum investment values can be updated by the owner.
- update_penality: Penality values can be updated by the owner.
- update_withdraw_limit: Withdraw limit values can be updated by the owner.
- update_Lockup_period: Lockup period values can be updated by the owner.
- update_Apy_Timeframe: APY Timeframe values can be updated by the owner.
- update_distributed_reward: Distributed reward values can be updated by the owner.
- update_Unstake_request_time: Unstake request time can be updated by the owner.
- update_APY: APY values can be updated by the owner.

To make the smart contract 100% decentralized, we suggest renouncing ownership of the smart contract once its function is completed.

Conclusion

We were given a contract code in the form of a <u>bscscan.com</u> web link. And we have used all possible tests based on given objects as files. We had observed 1 medium, 1 low and 8 informational issues in the smart contracts.but those are not critical ones. We confirm that these all issues are fixed / acknowledged in the revised smart contract code. So, **it's good to go for the production**.

Since possible test cases can be unlimited for such smart contracts protocol, we provide no such guarantee of future outcomes. We have used all the latest static tools and manual observations to cover maximum possible test cases to scan everything.

Smart contracts within the scope were manually reviewed and analyzed with static analysis tools. Smart Contract's high-level description of functionality was presented in the As-is overview section of the report.

Audit report contains all found security vulnerabilities and other issues in the reviewed code.

Security state of the reviewed smart contract, based on standard audit procedure scope, is **"Secured".**

Our Methodology

We like to work with a transparent process and make our reviews a collaborative effort. The goals of our security audits are to improve the quality of systems we review and aim for sufficient remediation to help protect users. The following is the methodology we use in our security audit process.

Manual Code Review:

In manually reviewing all of the code, we look for any potential issues with code logic, error handling, protocol and header parsing, cryptographic errors, and random number generators. We also watch for areas where more defensive programming could reduce the risk of future mistakes and speed up future audits. Although our primary focus is on the in-scope code, we examine dependency code and behavior when it is relevant to a particular line of investigation.

Vulnerability Analysis:

Our audit techniques included manual code analysis, user interface interaction, and whitebox penetration testing. We look at the project's web site to get a high level understanding of what functionality the software under review provides. We then meet with the developers to gain an appreciation of their vision of the software. We install and use the relevant software, exploring the user interactions and roles. While we do this, we brainstorm threat models and attack surfaces. We read design documentation, review other audit results, search for similar projects, examine source code dependencies, skim open issue tickets, and generally investigate details other than the implementation.

Documenting Results:

We follow a conservative, transparent process for analyzing potential security vulnerabilities and seeing them through successful remediation. Whenever a potential issue is discovered, we immediately create an Issue entry for it in this document, even though we have not yet verified the feasibility and impact of the issue. This process is conservative because we document our suspicions early even if they are later shown to not represent exploitable vulnerabilities. We generally follow a process of first documenting the suspicion with unresolved questions, then confirming the issue through code analysis, live experimentation, or automated tests. Code analysis is the most tentative, and we strive to provide test code, log captures, or screenshots demonstrating our confirmation. After this we analyze the feasibility of an attack in a live system.

Suggested Solutions:

We search for immediate mitigations that live deployments can take, and finally we suggest the requirements for remediation engineering for future releases. The mitigation and remediation recommendations should be scrutinized by the developers and deployment engineers, and successful mitigation and remediation is an ongoing collaborative process after we deliver our report, and before the details are made public.

This is a private and confidential document. No part of this document should be disclosed to third party without prior written permission of EtherAuthority.

Disclaimers

EtherAuthority.io Disclaimer

EtherAuthority team has analyzed this smart contract in accordance with the best industry practices at the date of this report, in relation to: cybersecurity vulnerabilities and issues in smart contract source code, the details of which are disclosed in this report, (Source Code); the Source Code compilation, deployment and functionality (performing the intended functions).

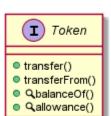

Due to the fact that the total number of test cases are unlimited, the audit makes no statements or warranties on security of the code. It also cannot be considered as a sufficient assessment regarding the utility and safety of the code, bugfree status or any other statements of the contract. While we have done our best in conducting the analysis and producing this report, it is important to note that you should not rely on this report only. We also suggest conducting a bug bounty program to confirm the high level of security of this smart contract.

Technical Disclaimer

Smart contracts are deployed and executed on the blockchain platform. The platform, its programming language, and other software related to the smart contract can have their own vulnerabilities that can lead to hacks. Thus, the audit can't guarantee explicit security of the audited smart contracts.

Slither Results Log

Slither is a Solidity static analysis framework that uses vulnerability detectors, displays contract details, and provides an API for writing custom analyses. It helps developers identify vulnerabilities, improve code comprehension, and prototype custom analyses quickly. The analysis includes a report with warnings and errors, allowing developers to quickly prototype and fix issues.

We did the analysis of the project altogether. Below are the results.
